*The science underpinning avian immunology is crucial to understanding basic immunological principles and the exceptional features of the avian immune system, as different strategies birds have adopted can provide important evolutionary insights.*

*This book provides the most complete picture of the avian immune system so far. The world-wide importance of poultry protein for the human diet, the threat of an avian influenza pandemic and heavy reliance on vaccination to protect commercial flocks world-wide demonstrates the need to review the important practical lessons in disease control presented here. \* With contributions from 33 of the foremost international experts in the field this book provides the most up-to-date and comprehensive review of avian immunology of the field so far \* Contains a detailed description of the avian innate immune system reviewing constitutive barriers, chemical and cellular responses; it includes a comprehensive review of avian Toll-like receptors \* Contains a wide-ranging review of the ‘Ecoimmunology’ of free-living avian species, assessing the importance of this subject for studying population dynamics and reviewing the methods and resources available for carrying out such research*

*Free-living birds encounter multiple health hazards brought on by viruses, bacteria, and fungi, some which in turn can significantly impact other animal populations and human health. Newly emerging diseases and new zoonotic forms of older diseases have brought increased global attention to the health of wild bird populations. Recognition and management of these diseases is a high priority for all those involved with wildlife. Infectious Diseases of Wild Birds provides biologists, wildlife managers, wildlife and veterinary health professionals and students with the most comprehensive reference on infectious viral, bacterial and fungal diseases affecting wild birds. Bringing together contributions from an international team of experts, the book offers the most complete information on these diseases, their history, causative agents, significance and population impact. Highly pathogenic avian influenza (HPAI) is a global health risk, as a major global (human) influenza pandemic could arise from evolution of the H5N1 virus that causes HPAI. This could cause significant loss of human life as well large economic losses. HPAI is considered endemic in many countries, including Vietnam, where HPAI outbreaks began in 2003 and have led to the death or culling of 59.3 million of head of poultry (Burgos et al., 2008) and 59 human deaths (World Health Organization, 2010). Given this risk, there is a need to better understand the economics of the animal health and the poultry sector at all levels. In particular poultry is a sector in transition with both traditional and modern sub-sectors and the response to HPAI may lead to reform of traditional sector. This dissertation considers both the producer response to HPAI outbreaks and evaluates consumer demand for traditional poultry and their willingness to pay for making it safer. The first chapter provides an introduction to HPAI and poultry sector issues in Viet Nam. The second chapter considers the production response to HPAI outbreaks, specifically the factors driving decision making of small poultry producers after outbreaks. There is currently little empirical evidence on the factors that drive decisions made by smallholders after outbreaks and models predicting farmer behavior are often theoretical or tested using cross sectional data. If the occurrence of epidemics allows farmers to update their beliefs on the likelihood of such epidemics and potentially experience losses, production levels and risk prevention activities should change. I test behavioral predictions based on profit maximizing behavior using survey data with detailed information on poultry production and disease prevention practices of small scale producers before and after a major avian flu outbreak in 2005, as well as household characteristics. I find that these producers have a small but statistically significant decrease in production due to outbreaks, and that disease prevention practices are also affected. The third chapter addresses consumer demand for different varieties of chicken, as different chicken production methods lead to differences in quality. In Vietnam, consumer demand for chicken produced under different conditions has important policy implications, including control of HPAI. In this chapter I estimate demand for 3 types of chicken in Hanoi, the capital of Vietnam, and am able to link higher incomes and education to increased consumption of traditionally-produced free range chicken. Although some studies have found evidence of westernization of Asian diets, this study indicates such findings do not extend to all food categories. The findings also indicate that policies that aim to decrease free range chicken production may meet resistance from consumers, even as income increases. The fourth chapter considers demand for safety labeled free range chicken in Vietnam. The valuation of safe food by consumers in developing countries affected by diseases such as avian influenza, or with food safety issues in general, is very difficult to identify. Products that have safety-branding or credible certification are not common, and food is usually purchased by bargaining at informal markets. Undertaking demand analysis under such conditions is very rare, especially for food characteristics. However, valuation of safety has important implications for livestock disease policies as well as agricultural sector development. I use data that was collected by an FAO project for a pilot certified supply chain for free range chicken in Hanoi and find that consumers in urban Hanoi on average have a welfare gain of about \$0.50-\$1.00 per whole chicken purchase for safety-branding and traceability. This indicates market-based policies have potential to increase the safety of poultry production and trading.

Selenium in poultry nutrition and health

Diseases of Poultry, 2 Volume Set

Diseases of Free-range Poultry

Selenium (Se) is an essential dietary trace element participating in the regulation of various physiological functions in humans, farm animals and poultry through its incorporation into a range of selenoproteins. Low Se content in main feed ingredients is a

common problem worldwide and dietary Se supplementation is a current practise in poultry and farm animal nutrition. Recent research clearly proved that sodium selenite, used for the last 40 years as a feed supplement, is not an optimal form of Se. However, use of organic selenium in animal/poultry diets can help meeting Se requirement and maintain high immunocompetence, productive and reproductive performance. The goal of this book is to provide up to date information about the roles of Se in poultry nutrition and health. A special emphasis is given to the role of selenium as an essential part of the integrated antioxidant system. Se in feed and organic Se are characterised in detail with emphasis to selenomethionine as a storage form of Se in the body. Also specific Se-deficiency related diseases in poultry are described and the importance of Se in growth, development, immunity and reproduction is demonstrated. A link between poultry industry and human health via production of Se-eggs and Se-enriched meat is shown. This book will be of practical importance to poultry producers, to nutritionists and vets as well as for avian/animal scientists, students of agricultural colleges and universities. It will also be of interest for researchers in areas related to ecology, environmental sciences, evolutionary biology, etc.

The most complete and definitive reference to all aspects of poultry diseases, Diseases of Poultry, Fourteenth Edition has been fully revised and updated to offer a comprehensive survey of current knowledge. Updates the definitive reference of poultry health and disease Provides more clinically relevant information on management of specific diseases, contributed by clinical poultry veterinarians Offers information on disease control in organic and antibiotic-free production Presents more concise, streamlined chapters for ease of use Incorporates advances in the field, from new diagnostic tools and information to changes brought about by the increasing globalization and the re-emergence of zoonotic pathogens

The present book contains concise information on major disease management through applied poultry vaccination and also practical knowledge in the field. The book is immensely helpful in understanding the formulation of vaccination schedules for broilers, layers and breeders. The present book not only covers the preventive aspects of diseases but also contains the detailed information on theoretical and applied practical aspects of poultry immunology and vaccination. Language of the book is simple, presentation is lucid and unambiguous for easy understanding. This book will definitely play a critical role in imparting knowledge in poultry egg and poultry meat industry in terms of disease free maximum/optimum production of good quality eggs and meat from poultry for human consumption. It is hoped that the book is quite useful for students, teachers and researchers of Poultry and Veterinary Science. This book is also a valuable reference source for poultry disease investigator, practicing veterinarian and poultry inspector.
